

Power. $V/1$ Water purification rate

Input Water Temp = 25

$\Delta t = 75^\circ\text{C}$

Flow rate = R gm/sec

Power = P

Output = Water @ 100°C

Specific heat: 4.187 J/gmk

Latent heat (evap): 2256 J/gm

Steady State

$$P = 4.187 \times 75 \times R + \text{losses}$$

$$\text{losses} = 0.2P$$

$$R = \frac{P - \text{losses}}{4.187 \times 75} = 0.4 \text{ ml/sec}$$

$$\approx 1.5 \text{ l/hr}$$

$$\approx 24 \text{ ml/hr}$$

if losses $\approx 20\%$ of P

Startup State

l = water in system

Sense

1. Measure amount of water in system
2. Temperature
3. Humidity

Can't measure flow rate as rate is too low.

Capture reject heat to preheat water.

Find

1. Rate of evaporation w/s height (pressure) \rightarrow
2. Temperature when:
 1. Optimum
 2. Too dry
 3. Too wet.
3. How much water can the wick's hold?
